about - awesome window ma... X

awesome

homeconceptsnewsdownloadcommunitywiki

A window manager is probably one of the most used software in your day-to-day tasks, with your Web browser, mail reader and text editor. Power users and programmers have a big range of choice between several tools for these day-to-day tasks. Some are heavily extensible and configurable.

awesome tries to complete these tools with what we miss: an extensible, highly configurable window manager.

To achieve this goal, **awesome** has been designed as a framework window manager. It's extremely fast, small, dynamic and heavily extensible using the [Lua](#) programming language.

We provide an easily usable and very-well documented API to configure and define the behaviour of your window manager.

Did you ever imagine press one key and see all your windows arranged automagically?

Did you ever imagine type a window's name and get it back in front of you?

Did you ever imagine `ssh` to a computer and see the load average of this one to be graphed directly in the titlebar of your terminal emulator?

awesome allow you to do that, and more, as long as you can express it in a programming language.

Features and non-features

- × Very stable;
- × Complete and very well documented source code and API;
- × No mouse needed: everything can be performed with keyboard;
- × Real multihead support (XRandR, Xinerama or Zaphod mode);
- × Implement many [Freedesktop](#) standards: [EWMH](#), [XDG Base Directory](#), [XEmbed](#), [System Tray](#);
- × Some real transparency support (using Composite extension and xcompmgr);
- × Doesn't distinguish between layers: there is no floating or tiled layer;
- × Whether or not the clients of currently selected tag(s) are in tiled layout, you can rearrange them on the fly. Popup and fixed-size windows are always floating, however;
- × Layout handling: can automatically manage your windows placement according to the chosen policy for each tag;
- × Use tags instead of workspaces: allow to place clients on several tags, and display several tags at the same time;
- × [D-Bus](#) support;
- × And more.

This gonna be LEGEN... wait for it... DARY!

18 We provide an easily usable and very-well documented API to configure and

19 define the behaviour of your window manager.

20

21 Did you ever imagine press one key and see all your windows arranged

22 automagically?

23

24 Did you ever imagine type a window's name and get it back in front of you?

25

26 Did you ever imagine `*ssh*` to a computer and see the load average of this one

27 to be graphed directly in the titlebar of your terminal emulator?

28

29 **awesome** allow you to do that, and more, as long as you can express it in a

30 programming language.

31

32 # Features and non-features

33 * Very stable, fast, small and simple;

34 * Complete and very well documented source code and API;

35 * No mouse needed: everything can be performed with keyboard;

36 * Real multihead support (XRandR, Xinerama or Zaphod mode);

37 * Implement many [Freedesktop](#) standards: [EWMH](#) (<http://standards.freedesktop.org/wm-spec/wm-spec-latest.html>),

38 [XDG Base Directory](#) (<http://standards.freedesktop.org/basedir-spec/basedir-spec-latest.html>),

39 [XEmbed](#) (<http://standards.freedesktop.org/xembed-spec/xembed-spec-latest.html>),

40 [System Tray](#) (<http://standards.freedesktop.org/systemtray-spec/systemtray-spec-latest.html>);

41

42 * Some real transparency support (using Composite extension and xcompmgr);

43 * Doesn't distinguish between layers: there is no floating or tiled layer;

44 * Whether or not the clients of currently selected tag(s) are in tiled layout,

45 you can rearrange them on the fly. Popup and fixed-size windows are

46 automatically floating.

47 * Layout handling: automatically manage your windows placement according to

48 the chosen policy for each tag;

49 * Use tags instead of workspaces: allow to place clients on several tags, and

50 display several tags at the same time;

Hi all,

there is another issue with the progressbar (probably also with the graph).

area_t is used as something like a vector - for the color-gradient.

Therefore width and height can have negativ values, and therefore should not but unsigned, what area_t is so.

So, either something different to area_t as a 'vector' has to be

PGP signature successfully verified.

Fact: Tiling WMs are better than Stacking WMs

- Great increase in productivity
- Highly customizable
- Utilities from other WMs can still be used

Characteristics of i3wm

- Direct control of window tree
- Settings stored in easily-read text file
- vim-like window navigation and resizing
- Floating window support (good for popups)

i3bar

- Area to display system statistics
- User configurable (accepts JSON input)
- Uses 'i3status' by default
- Supports click events

.07GB | 0KB | 0KB | 22:44PM | 95% | 42.0C

Check out my config and find

dwm, written in C

~20KB

goal of creator: <2000

no configuration file, edit headers as configuration

awesome -

lots of tiling wm's are similar

Great increase in productivity

Highly customizable

Utilities from other WMs can still be used

started in 2009, written in c, good documentation

differences:

- uses text configuration file

- split and move windows any way you want

#####

- open new workspace, create windows

- keyboard navigation much faster than swapping between mouse and keyboard

- vim like navigation, resizing

- move windows around/different workspace

- floating windows – calculator

- can still use xfce utilities

- config – change modkeys, set shortcuts, set colors

Direct control of window tree

Settings stored in easily-read text file

vim-like window navigation and resizing

Floating window support (good for popups)

Area to display system statistics

User configurable (accepts JSON input)

Uses 'i3status' by default

Supports click events
